Re: Protection of shareholder records

Goldbelt strives to provide appropriate protection for shareholder records. Shareholders should be aware of the following measures adopted for protection of their records:

1. Records are stored in a password protected database located on a physically secured dedicated database server.
2. In addition to the physical security described above, shareholder records are protected from corruption caused by failures in the building's electrical system or from the power company. Data is also protected from failures in server hard disks, server power supply, or extreme temperature variation.
3. Shareholder records are further protected against tampering by file protection software. Virus definitions are updated daily; files are scanned no less than weekly.
4. Network access to shareholder records is limited to only those with permission to log onto the Goldbelt network, permission to access the file server folders containing the database, and yet a third level of permission to access the shareholder database application.
5. Systems are in place to prohibit unauthorized external access to the Goldbelt network from the Internet.
6. Every effort is made to prevent the use of email to damage or gain access to data stored on Goldbelt servers.
